About This Guide

The *PayPal Intégral Evolution Integration Guide* describes how to integrate with Intégral Evolution. It includes information about:

- Features and benefits of Intégral Evolution.
- Seller Protection.
- Moving from Website Payments Standard to Intégral Evolution.
- Integrating your website with Intégral Evolution.
- Customising your hosted payment page.
- Testing your integration in the Sandbox environment.
- Verifying the status and authenticity of the transactions before fulfilling the orders.

Intended Audience

This guide is for merchants and developers that want to integrate with Intégral Evolution to add transaction processing to their website.

Intégral Evolution is not available in the United States. It is only available in the countries in the table below. The product name may vary from country to country.

<table>

Revision History

Revision history for PayPal Intégral Evolution Integration Guide.

**TABLE P.1 Revision History**

<table>
<thead>
<tr>
<th>Date</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>May 2014</td>
<td>Updated the secure payments URL shown in the examples throughout the guide. Removed the s-xclick command from all examples and also updated the example hosted button IDs to use HSSS instead of HSS.</td>
</tr>
<tr>
<td>October 2013</td>
<td>Updated the list of supported browsers in Integrating iFrame in Your Website.</td>
</tr>
<tr>
<td>August 2013</td>
<td>Updated the Testing Your Integration in Sandbox and Error Messages chapters. Updated the possible values of the language code lc request field in the HTML Variables for Payment Page Settings section. Added a note in the Verifying Transaction Status and Authenticity section on the PayPal account settings which result in appending each Transaction ID to your return URL. Updated content and URLs.</td>
</tr>
<tr>
<td>February 2013</td>
<td>Added a section on The Mobile Optimized Payment Flow. Updated the values of the template HTML variable in the HTML Variables for Payment Page Look and Feel table. Added information on mobile optimized payment pages in the Integrating iFrame in Your Website chapter.</td>
</tr>
<tr>
<td>October 2012</td>
<td>Added the new payment page customisation features to the Customising Your PayPal Payment Page chapter.</td>
</tr>
<tr>
<td>August 2012</td>
<td>Updated the Intended Audience section. Updated the endpoint in the examples.</td>
</tr>
<tr>
<td>July 2012</td>
<td>Removed references to the deprecated HTML variable: shopping_url</td>
</tr>
<tr>
<td>June 2012</td>
<td>● Updated the requirements for the billing address fields in the HTML Variables for Payment Page Settings section.</td>
</tr>
<tr>
<td></td>
<td>● Added a character limitations note to the following sections: HTML Variables for Payment Page Settings, HTML Variables for Payment Page Look and Feel and BMCreateButton API Operation.</td>
</tr>
<tr>
<td></td>
<td>● Corrected the HTML samples in Chapter 2 and Chapter 5.</td>
</tr>
</tbody>
</table>

<tr>
<td>May 2012</td>
<td>Added IE9 to list of browsers that support iFrame.</td>
</tr>
</tbody>
</table>

Documentation Feedback

Help us improve this guide by sending feedback to:

documentationfeedback@paypal.com
Overview

PayPal Intégral Evolution is a payment platform allowing merchants to receive payments funded by card or PayPal account. This solution is hosted by PayPal. You do not have to capture or store credit card information on your website, thereby helping towards achieving PCI compliance.

Intégral Evolution is the choice for merchants who prefer a solution where all financial details are handled by PayPal.

In addition to Intégral Evolution, PayPal recommends that you implement the PayPal Express button on your website. The button appears much earlier in the payment flow and gives existing PayPal account holders the opportunity to use PayPal, thereby increasing the transaction completion rate.

Features and Benefits

Here are the features and benefits of Intégral Evolution:

- **PCI compliance** - Payment Card Industry (PCI) Data Security Standards (DSS) is a global security standard which applies to all businesses that collect, store, process, or transmit card holder information. You can use PayPal’s hosted payment page as part of the PCI compliance solution for your business.

  **Note:** Intégral Evolution implementation helps achieving PCI compliance, and does not necessarily guarantee it.

- **Supports iFrame** - PayPal offers a compact payment form that can be integrated in an iFrame on your website. The buyer completes the payment on your website and you can maintain the checkout look and feel in the master frame that surrounds the compact form. The credit card fields are part of the compact form so you do not have to collect this information separately. For more information, refer to “Integrating iFrame in Your Website” on page 43.

- **PayPal e-Terminal** - PayPal-hosted online payment form, which enables you to accept phone fax, mail orders for all major credit cards.

- **Seller Protection** - This program protects you against chargebacks on transactions funded by credit card or a PayPal account. For more information, refer to “Seller Protection” on page 13.

- **PayPal Express** - Two-click payment option for PayPal account holders. For more information, refer to “PayPal Express Transaction Processing” on page 14.
- **Supports Major Credit and Debit Cards** - Supports Visa, MasterCard, Carte Bancaire, Carte Aurore, Cofinoga, and 4 étoiles.

- **Mobile Support** - Intégral Evolution payment pages are optimized for both desktop and mobile browsers. For more information, refer to “The Mobile Optimized Payment Flow” on page 38.

---

**How Intégral Evolution Works**

In the figure above, the top flow is for paying using your PayPal account and the bottom flow is for paying with a card.

To integrate your website with Intégral Evolution:

1. Generate a button in your website checkout flow using HTML or API solution. The button could be labeled **Pay** or **Buy** or similar. When the buyer clicks this button, they are redirected to the payment page hosted by PayPal.

2. On the payment page, the buyer enters their debit or credit card information and clicks the **Pay Now** button. They do not have to have a PayPal account, although they have the option to use it if they have one.

3. If the transaction is successful, the buyer either sees PayPal’s confirmation page or is redirected to a URL you specify. If the transaction is unsuccessful, an error message is displayed, and the buyer can rectify the error and retry the transaction.

You can specify the content of the payment page and configure its appearance to reflect the look and feel of your website (including your logo).
Seller Protection

If PayPal is the only payment method on your website, transactions processed through Intégral Evolution are eligible for PayPal’s Seller Protection. It covers payments done through the payment flow of your website for items sold domestically and internationally. These items can be purchased using a credit card or through the PayPal account.

To benefit from Seller Protection, the purchased item must be shipped to the address you communicated to PayPal.

For this, you must perform the following tasks:

- Send all the details of the billing and shipping address provided by the buyer in the Form POST.
- Set the `address_override` variable to `true` and `showShippingAddress` variable to `false` (or unselect it in the Settings page on your Profile page).

**IMPORTANT:** Conditions apply. To see all conditions, please refer to PayPal e-Terminal and Intégral Evolution User Agreement.

Instant Payment Review

To take advantage of Seller Protection, you must integrate with Instant Payment Review. Payment Review is a feature that identifies high-risk transactions and notifies you so that you can hold shipments until the risk has been evaluated by PayPal. It is made available to all merchants and it reduces seller loss and makes the transactions eligible for Seller Protection.

When a transaction is initiated, PayPal runs additional buyer-risk assessment. PayPal scores all transactions (Authorization and Sale) instantly and flags high-risk transactions as “Under Review” and you are immediately notified. You should not ship merchandise or, in the case of electronic media, you should not allow download access while the payment is under review. PayPal fraud agents review the transaction within 24 hours and update the order as Completed (released as safe by Payment Review) or Reversed (rejected by Payment Review). For risky transactions, PayPal advises you to not ship the items until the transaction has been determined as Completed. Payments that are completed are eligible for PayPal’s Seller Protection.

You can determine the status of a payment in the following ways:

- Logging into https://www.paypal.com and viewing the status information in the Transaction History.
- Checking email sent by PayPal
- Reviewing the Instant Payment Notification (IPN) message
Verifying the status of a transaction programatically. To check the initial status of a transaction, use any of the following API operations:

- DoExpressCheckoutPayment
- DoReferenceTransaction
- DoAuthorization
- DoReauthorization

You can check the subsequent status of a transaction programatically by calling the GetTransactionDetails API operation. For more information, refer to “GetTransactionDetails API” on page 73.

**NOTE:** You must use version 58.0 (or +) of the API to obtain the initial status information provided by DoExpressCheckoutPayment, DoReferenceTransaction, DoAuthorization, or DoReauthorization.

To use payment review with DoExpressCheckoutPayment, DoReferenceTransaction, DoAuthorization, and DoReauthorization Payment API operations, you must

1. Check the payment status in the response to the API operation; specifically, check whether PaymentStatus is set to Pending.

2. If the PaymentStatus is set to Pending, check whether the PendingReason is set to PaymentReview, because there are other reasons that a transaction may become pending. For example, an unsettled authorization’s PaymentStatus is set to Pending; however, its PendingReason is set to authorization, which is not related to payment review.

If PaymentStatus is set to Pending and the PendingReason is set to PaymentReview, you should not ship merchandise or, in the case of electronic media, you should not allow download access.

Because the payment status will change after review, you must periodically check the payment status using the GetTransactionDetails API operation, checking email from PayPal, reviewing IPN messages, or checking the Transaction History on [https://www.paypal.com](https://www.paypal.com).

---

**PayPal Express Transaction Processing**

PayPal Express is a 2-click payment solution allowing to boost your conversion rate. It enables the buyers to use shipping information stored securely at PayPal to check out, so they do not
have to re-enter it on your site. This solution can be placed on both the product page as well as the shopping cart page.

The following steps describe how PayPal Express works.

1. After selecting products to purchase on your website, buyers click **Pay with PayPal** button.

2. They are redirected to the PayPal site where they log in using their PayPal login and password.

3. After logging in, they review the order summary, and click **Continue Checkout** to authorise the transaction.

4. The buyers are then returned to the confirmation page on your website where they can verify the order details and submit the transaction.

For complete details on PayPal Express Checkout, refer to the [Express Checkout Integration Guide](#).

---

### Introduction to Integrating with Intégral Evolution

After signing up for Intégral Evolution, follow these steps to integrate your website with Intégral Evolution:

1. Connect your website to Intégral Evolution: Identify a point in your website checkout flow where you want to place a **Pay** or similar button that the buyer clicks on to initiate the payment. You can do this using HTML or API. Clicking on this button redirects the buyer’s browser to PayPal’s payment page for transaction processing. Depending on how you want to integrate, follow the steps described in Chapter 2, “Integrating Your Website Using HTML” on page 17 or Chapter 5, “Integrating Your Website Using API” on page 49.

2. Optionally, customise the appearance and content of your PayPal-hosted payment page by either sending the appropriate HTML variables or by editing your PayPal account settings. Refer to Chapter 3, “Customising Your PayPal Payment Page” on page 23.
3. Optionally, test your integration in the PayPal Sandbox environment. This step is described in Chapter 6, “Testing Your Integration in Sandbox” on page 57.
Integrating Your Website Using HTML

This chapter provides instructions for a simple integration that enables you to begin processing transactions using Intégéral Evolution.

**NOTE:** PayPal recommends that you implement the simple integration to familiarize yourself with Intégéral Evolution before implementing a more customized integration.

As part of a simple integration, you get the default settings on your payment page. To customize the look and feel of the page so it matches your website, you can do one of the following:

- Change your settings in your Profile section on PayPal.com, as described in “Modifying Your PayPal Account Settings” on page 24.
- Add the appropriate HTML variables to the payment page, as described in Table 2.1, “HTML Variables for Settings of Payment Page” on page 19 and Table 3.2, “HTML Variables for Look and Feel of Payment Page” on page 40.

**IMPORTANT:** HTML variables will override the settings you save on your profile page.

---

**Simple Intégéral Evolution Integration**

To integrate your website with Intégéral Evolution, identify a point in your website checkout flow where you want to place a button that the buyer clicks to initiate the payment. The button should be labeled **Continue to Payment, Pay** or similar, and when clicked, should execute a Form POST to PayPal. Clicking on this button redirects the buyer’s browser to the PayPal payment page where they can pay with credit card, or their PayPal account.

The Form POST contains a set of HTML variables that describe the transaction. In the Form POST, you must specify the following:

- **subtotal** - amount of the transaction
- **business** - Secure Merchant ID (found on the profile page) or the email address associated with your PayPal account.
- **paymentaction** - Indicates whether the transaction is for payment on a final sale or an authorisation for a final sale (to be captured later).

The default currency is USD. Additionally, you can specify the appropriate HTML variables listed in Table 2.1, “HTML Variables for Settings of Payment Page” on page 19 to customise the information collected on the payment page or Table 3.2, “HTML Variables for Look and Feel of Payment Page” on page 40 to customise the look and feel of the page. If the payment is successful, then the buyer either sees the PayPal confirmation page or is redirected to the URL you specify in your configuration.
The return URL is appended with a Transaction ID on the query string during the redirect back from the payment page to your website. This Transaction ID can be used to retrieve the status and verify the authenticity of the transaction. For detailed information on verifying the authenticity of the transaction before fulfilling the order, refer to Chapter 7, “Order Processing” on page 63.

Sample Integration

Below is an example of a simple Intégral Evolution integration:

1. Sample Intégral Evolution Form POST:

   ```html
   <input type="hidden" name="cmd" value="_hosted-payment">
   <input type="hidden" name="subtotal" value="50">
   <input type="hidden" name="business" value="HNZ3QZMCPBAAA">
   <input type="hidden" name="paymentaction" value="sale">
   <input type="hidden" name="return" value="https://yourwebsite.com/receipt_page.html">
   <input type="submit" name="METHOD" value="Pay">
   </form>
   ```

   The bold text is the value for the corresponding variable. It is recommended that you enclose the values in quotes. For detailed information on these values, refer to Table 2.1, “HTML Variables for Settings of Payment Page” on page 19.

2. Output the HTML text into your website at the point where buyers will proceed with their checkout.

3. Open your checkout page and test the button to ensure that it opens the PayPal payment page.

   You can also use the PayPal sandbox environment to test your integration. For complete information on testing your integration in the PayPal Sandbox environment, refer to Chapter 6, “Testing Your Integration in Sandbox” on page 57.
HTML Variables for Payment Page Settings

The table below lists the Intégral Evolution HTML variables you can use to send in additional transaction information along with your web request. For a list of HTML variables that you can use to customise the look and feel of your payment page, refer to Table 3.2, “HTML Variables for Look and Feel of Payment Page” on page 40.

**NOTE:** The values you pass must not contain any of these special characters (){}<>";

**NOTE:** Some merchants are required to pass billing information with every transaction. It is recommended that you test your integration first, particularly if you plan to use iFrame, to determine if the billing information fields are required.

**Table 2.1 HTML Variables for Settings of Payment Page**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
<th>Required</th>

Customising Your PayPal Payment Page

You can customise the look and feel of the PayPal payment page in the following two ways:

- Using HTML Variables for Payment Page Look and Feel.

**NOTE:** HTML variables will override the account settings you save on your profile page. This chapter also includes information on The Mobile Optimized Payment Flow.

**NOTE:** Your payment page will appear to customers after you complete your HTML integration.
Modifying Your PayPal Account Settings

The settings and appearance of your PayPal payment page can be customised. To modify your payment page, login to your account on PayPal.com. On the Profile page, under the Website payment settings section, select:

- **Settings**: to configure your payment page settings.
- **Customisation**: to specify your payment page layout and appearance.
Customising Your PayPal Payment Page

Modifying Your PayPal Account Settings

Settings

**Figure 3.1 Settings - Settings Overview page**

From the Settings overview page you can navigate to each of the following tabs to configure the settings of your PayPal payment page:

- **Customer Information**: Specify if you would like to display the customer’s billing or shipping information on your payment page and which fields are required or editable.

- **Payment Confirmation Page**: Choose the settings for your payment confirmation page. This is the page that your customers see after a successful transaction.

- **Email Receipt**: Select to send your customers an email receipt and customise this email receipt.

- **URLs and Data Transfer**: Specify the significant URLs on your website. PayPal will redirect your customers from your PayPal payment page to the URLs you provide.

- **General Settings**: Customise the payment page button label.

The Settings overview page also includes a link to the PayPal developer portal and a link to the Customisation page where you can modify the appearance of your payment page.

**Customer Information**

From the Customer Information settings tab, you can select if you would like to display Billing information and Shipping information fields on your PayPal payment page. When you check the checkbox next to either Billing information or Shipping information, a list of applicable fields appears on the page. All of the listed fields will be displayed on your payment page.
Customising Your PayPal Payment Page

Modifying Your PayPal Account Settings

**FIGURE 3.2 Settings - Customer Information page**

From this list of customer information fields you can select which fields you would like to make editable or required on your payment page. Check the box next to each required field in the *make these fields required* section and next to the editable fields in the *make these fields editable* section.

PayPal recommends that you display as few options as possible on the payment page. Also, if you choose to collect information on the payment page that you have already collected on your website, this creates a poor buyer experience. For example, you may have already collected shipping address on your own website to calculate the shipping cost. Therefore, it is not necessary to collect this information again on the payment page.
Instead of collecting the buyer’s shipping address again on the PayPal payment page, you can pass to PayPal the shipping address information which you already collected. PayPal will then display the pre-filled and editable shipping address fields on your payment page. For more information on passing values to the PayPal payment page go to: “HTML Variables for Payment Page Settings” on page 19.

From the Customer Information page tab you can choose whether to display the following customer billing information or shipping information fields on your payment page. You can also determine which of these fields will be required and/or editable.

**NOTE:** Some merchants are required to pass the customer’s billing information with every transaction. It is recommended that you test your integration first, particularly if you plan to use the iFrame integration, to determine if the billing information fields are required.

You can also override the Customer Information tab settings at transaction time by passing HTML variables to the PayPal payment page. For more information see: “HTML Variables for Payment Page Look and Feel” on page 40.

### Payment Confirmation Page

From the Payment Confirmation Page tab, you can specify which page the buyer will see after making a successful payment. You can choose to display either a PayPal confirmation page or a payment confirmation page hosted on your website:
Customising Your PayPal Payment Page

Modifying Your PayPal Account Settings

**FIGURE 3.3 Settings - Payment Confirmation Page**

- **On my site’s confirmation page**
  
  If you select this option, you are asking PayPal to redirect the buyer to your own payment confirmation page hosted on your website. You will be asked to provide the *Return URL*. The *Return URL* is the first page the customer sees on your site after leaving the PayPal pages. If you choose to host your own payment confirmation page, enter the path to your payment confirmation page in the *Return URL* field.

  When PayPal redirects the buyer to a payment confirmation page hosted on your website, you will have to include a message on this page about the outcome of the transaction. Be sure to display the specifics of the order using the Transaction ID that is passed back to you.

- **On a PayPal confirmation page**
  
  By selecting this option you are choosing to display a PayPal hosted confirmation page to the buyer. You can customise your PayPal hosted confirmation page with the following information:
  
  - *(Optional)* header text
Customising Your PayPal Payment Page

Modifying Your PayPal Account Settings

– (Optional) footer text
– Customer service phone number.
   To update your customer service contact information go back to the Profile page.
– Customer service email address.
   To update your customer service contact information go back to the Profile page.
– Return URL
   The Return URL is the first page the customer sees on your site after leaving the PayPal pages. In the the Return URL field, enter the path to a page on your site that you would like buyers to see after the PayPal payment confirmation page. The buyer returns to your site by clicking a link on the PayPal confirmation page. You can customise the link text.
– Text for return button / link
   Here you can specify the text of the link on the PayPal confirmation page that sends the user back to your site.

   To change how information is sent from PayPal to your web server, via HTTP POST or GET, go to the URLs and Data Transfer settings tab.

Email Receipt

From the Email Receipt settings tab, you can specify if you would like PayPal to send an email receipt to the buyer after a successful transaction. This feature is disabled by default. To enable it, check the checkbox next to Allow PayPal to email receipts.

You can customise the following information in the email receipt page:

- Sender’s email address
- Reply-to email address (optional)
- Display your business name or logo?
   You can select from the following options:
   – Show my business name as text
   – Show my business logo
   – Do not display
- Header text (optional)
- Footer text (optional)
- Customer service phone number
- Customer service email address

To update your customer service contact information, go back to the Profile page.
**FIGURE 3.4 Settings - Email Receipt**

**Customising email receipts**

After your customers pay, we email receipts to them. To customize the receipt, you can choose which email addresses appear in the "From" and "Reply to" fields, and add header and footer text. See examples.

- Allow PayPal to email receipts:
  - Sender email address
- Reply to email address (optional)

**Display your business name or logo?**
- Show my business name as text
- Show my business logo
- Do not display

**Footer text (optional)**

CUSTOMER SERVICE

**Customer service phone number**
165169339

**Customer service email address**

To edit your customer service information, go to your Profile.

---

**URLs and Data Transfer**

The **URLs and Data Transfer** settings help you manage how data is transferred between PayPal and your website (via GET or POST). You can also set your Cancel and Error URL values here. To modify the Return URL, go to the Payment Confirmation Page.
You can configure the following settings from the **URLs and Data Transfer** tab:

### Data transfer method

Select the HTTP method you would like PayPal to use to send back payment data to your web server. This data transfer method applies to Return, Cancel and Error URLs. The options are:

- **GET**
- **POST**

### Cancel URL

If a customer chooses to cancel a payment, this link will direct the customer back to a page on your site that you specify.
● **Cancel URL**

Enter the URL of the page on your website where the buyer should return to if the buyer chooses to cancel the payment.

You can also set the Cancel URL dynamically at transaction time by passing a HTML variable to PayPal. This HTML variable will override the Cancel URL specified in your account settings. For more information, go to: “HTML Variables for Payment Page Settings” on page 19.

● **Text for Cancel URL**

Here you can customize the text of the payment cancellation link displayed on your PayPal payment page.

**Error URL**

This is the URL of the page on your website that PayPal should redirect buyers to if an error occurs during the payment transaction.

**General Settings**

The *General Settings* page helps you customise PayPal payment page further.

**Payment page button text**

You can customise the text on the *Pay Now* button.

*Figure 3.6 Settings - General Settings*
Customisation

The Customisation page allows you to customise the layout and appearance of your PayPal payment page. Here you can select one of the available page layouts. Depending on which layout you select, you can customise the header, the background color, the subheader text, the color of the pay button, the color of the button text, and the order summary section of your payment page. PayPal payment pages are optimized for both desktop and mobile browsers. To learn more about payment page behavior with mobile browsers see “The Mobile Optimized Payment Flow” on page 38.

At the top of the page, you will see the four layout templates that PayPal offers. Template A is the default template. You can select any one of these templates. If you would like an iFrame integration, select the MiniLayout template.

After you select the layout template you prefer, you can customise individual sections of this template. To make changes to a section, left-click on the section you are trying to modify or on the corresponding Click to Edit button for that section. A pop-up window will appear containing the settings applicable to that section, such as a color selector to change the color or a field for you to enter text.

When you have completed customising your layout template, click one of the following buttons:

- **Preview** - Preview the changes you have made to your template before saving and publishing it.
- **Save and Publish** - Save all of the changes you have made and publish the updated template. Your buyers will see the updated payment page.
- **Cancel** - Discard all the changes you have made in this session.
- **Previous Version** - Discard all changes you have made since the last time you saved the template. Your buyers will see the last saved template.

**Note:** You must make all modifications (including changing templates) within the same session, otherwise all changes will be lost and you will have to redo your changes. If the session times out, the design of the template will remain at the version that was last saved and published.

**Choosing a Template**

Choose from the following four design templates:

- **Layout A**
- **Layout B**
- **Layout C**
- **MiniLayout**
**Layout A.** Layout A is selected by default. Layout A consists of a header at the top of the page, a payment method section on the left and an order summary section on the right. You can only customise the header in this layout. You can specify the height of the header, show your company name in text or upload your company logo. You can also choose the horizontal alignment of the header.

**Note:** For Layout templates A, B and C, when the payment page is viewed from a supported mobile browser, PayPal automatically displays a mobile-optimized payment flow instead of the layout template. The mobile-optimized payment pages cannot be customized and will look the same for layouts A, B and C.

**Figure 3.7 Customisation - Layout A**
Layout B. Layout B has the most customisation options. Like Layout A, it consists of a header at the top of the page, a payment method section to the left and an order summary section to the right. In Layout B, you can also customise the header background color, the page background color or choose a page background image. In the payment method section on the left, you can choose the colors of the subheader text, the section border, the Pay button, and the Pay button text. In the order summary section on the right, you can customise the background color or use a background image.

**Note:** For Layout templates A, B and C, when the payment page is viewed from a supported mobile browser, PayPal automatically displays a mobile-optimized payment flow instead of the layout template. The mobile-optimized payment pages cannot be customized and will look the same for layouts A, B and C.

**Figure 3.8 Customisation - Layout B**
**Layout C.** In Layout C, the order summary section appears towards the top of the page, just below the header and is followed by the Payment method section. Similar to Layout B, Layout C allows you to customise the header, the page background and the colors on the payment method section. However, you cannot customise the order summary section.

**NOTE:** For Layout templates A, B and C, when the payment page is viewed from a supported mobile browser, PayPal automatically displays a mobile-optimized payment flow instead of the layout template. The mobile-optimized payment pages cannot be customized and will look the same for layouts A, B and C.

**Figure 3.9 Customisation - Layout C**

---

![Customisation - Layout C](image-url)
**MiniLayout.** Unlike the other layouts, MiniLayout shows only the payment method section. There is no header or order summary section. MiniLayout can either be displayed in a stand-alone popup window or framed on your site in an iFrame. For more information on the iFrame integration, see “Integrating iFrame” on page 44. The size of the MiniLayout is fixed at 490 x 565 pixels, with extra space to allow for error messages.

In MiniLayout you can customise the subheader text color, the border color, the Pay button color and the Pay button text color.

**NOTE:** For MiniLayout, when the payment page is viewed from a mobile browser, PayPal will not display a mobile-optimized flow. The reason is that if PayPal automatically displayed a mobile optimized embedded template within a merchant web page that may not be mobile optimized, this can create unexpected and undesirable results. To display a mobile optimized flow, pass either `mobile` or `mobile-iframe` in the `template` HTML variable at transaction time.

**Figure 3.10 Customisation - MiniLayout**
**Layout Template Customisation Options**

Consider the following when you customise your template:

- **Header** (applicable to Layouts A, B, and C) - By default, the business name from your profile is shown in the header. You can change the following:
  - Header height and color
  - Font type, size, and color
  - Swap between displaying the business name or the business logo image
  - Position of the business name or the logo
  - In Layouts B and C you can also change the header background color.

- **Page Background** (applicable to Layouts B and C) - You can change the following:
  - Background color
  - Background image URL

- **Payment Method Section** (applicable to Layouts B, C and MiniLayout) - You can change the following:
  - Section border color
  - Subheader text color
  - Pay Button color and button text color

- **Order Summary Section** (applicable to Layout B only) - You can change the following:
  - Section background color
  - Background image URL

---

**The Mobile Optimized Payment Flow**

The PayPal payment page is optimized for mobile browsers. If you are using layout templates A, B or C, when a buyer views the payment page from a supported mobile browser, PayPal automatically displays a mobile-optimized payment flow instead of the layout template.

*NOTE:* The mobile-optimized payment pages cannot be customized and will look the same for layouts A, B and C.

For template D, which is also known as MiniLayout or the iFrame integration, when the payment page is viewed from a mobile browser, PayPal will not display a mobile-optimized flow. The reason is that if PayPal automatically displayed a mobile optimized embedded template within a merchant web page that may not be mobile optimized, this can create unexpected and undesirable results. To display a mobile optimized flow, pass either mobile or mobile-iframe in the template HTML variable at transaction time. For more...
Customising Your PayPal Payment Page
The Mobile Optimized Payment Flow

information, see the template HTML variable in “HTML Variables for Payment Page Look and Feel” on page 40.

**Table 3.1 The template HTML Variable**

</tr>
<tr>
<td>mobile-iframe</td>
<td>Displays default web layout.</td>
<td>Displays mobile iFrame layout.</td>
</tr>
</tbody>
</table>

Figure 3.11, “Mobile Payment Flow for a PayPal Payment” and Figure 3.12, “Mobile Payment Flow for a Credit Card Payment” show examples of the mobile optimized payment flow.

*Figure 3.11 Mobile Payment Flow for a PayPal Payment*
The table below lists the HTML variables that you can use to customise the look and feel of your payment page. The HTML variables that you pass at transaction time will override your payment page settings in your PayPal account profile. For additional HTML variables, refer to: HTML Variables for Payment Page Settings.

**NOTE:** The values you pass must not contain any of these special characters: `(){}<>\"`

### Table 3.2 HTML Variables for Look and Feel of Payment Page

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>

</table>
Customising Your PayPal Payment Page

HTML Variables for Payment Page Look and Feel

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
</table>
| template | The layout template that will be used for your payment page. You can override the layout template in your account profile settings by passing one of the following values at transaction time: 

**NOTE:** For Layout templates A, B and C, when a buyer views the payment page from a supported mobile browser, PayPal automatically displays a mobile-optimized payment flow instead of the layout template. The mobile-optimized payment pages cannot be customized and will look the same for layouts A, B and C.

- templateA - Sets the payment page template to layout template A.
- templateB - Sets the payment page template to layout template B.
- templateC - Sets the payment page template to layout template C.
- templateD - Sets the payment page template to the MiniLayout (iFrame integration) template. When the payment page is viewed from a mobile browser, PayPal will not display a mobile-optimized flow. The reason is that if PayPal automatically displayed a mobile optimized embedded template within a merchant web page that may not be mobile optimized, this can create unexpected and undesirable results. To display the mobile optimized payment flow, pass either mobile or mobile-iframe in the template HTML variable at transaction time.

**NOTE:** If using template A, B, or C, no action is required to display mobile-optimized payment pages; PayPal auto-detects if the buyer is on a mobile browser and automatically displays a mobile-optimized flow. However, for templateD, which is also known as MiniLayout or the iFrame integration, to display the mobile optimized payment flow, you must pass either mobile or mobile-iframe at transaction time.

- mobile - Displays the mobile-optimized payment flow. Pass this value if you are using templateD, which is also known as MiniLayout or the iFrame integration, and you would like to display the mobile optimized flow without an iFrame.
- mobile-iframe - Displays a mobile-optimized page with an iFrame Pass this value if you are using templateD, which is also known as MiniLayout or the iFrame integration, and you would like to display the mobile optimized flow with an iFrame.
PayPal offers a compact payment form that can be integrated in an iFrame on your website. Since this form is integrated on your website, the buyer never leaves your website, thereby reducing potential drop-offs. You can also maintain your checkout look and feel in the master frame that surrounds the compact payment form. The credit card fields are part of the compact payment form so you do not have to collect this information separately.

**IMPORTANT:** Due to security concerns involving iFrame, the following browsers are supported and secure to use - Internet Explorer 7.0, 8.0 and 9.0, Firefox 24, Chrome 30, Safari 4.x and 5.x. Transactions involving users of other browsers should not use the iFrame flow or abandon the transaction. Additionally, there is another risk beyond the iFrame flow - should the PayPal iFrame become the source of an attack, it would appear that the attack is originating from the merchant site; do not use the iFrame flow if you wish to avoid this additional risk.

**NOTE:** Due to spoof concerns, the form does not contain any PayPal branding.

If you would like an iFrame integration you must use the MiniLayout template. You can either select MiniLayout from the Customisation page of your PayPal account. Or you can pass the HTML variable Template=TemplateD at transaction time. The examples in this chapter use the latter HTML variable method to set the MiniLayout template.

For MiniLayout, when the payment page is viewed from a mobile browser, PayPal will NOT automatically display a mobile-optimized payment flow. The reason is that if PayPal automatically displayed a mobile optimized embedded template within a merchant web page that may not be mobile optimized, this can create unexpected and undesirable results. To display a mobile optimized flow, pass either mobile or mobile-iframe in the template HTML variable at transaction time.

The MiniLayout template (the compact payment form) contains the following fields:

- Credit card number
- Expiry date
- CVV2 number (if applicable, based on the card type)
- Any additional fields required for other card types, such as start date and issue number for Maestro or Switch.

This template also offers the following options:

- Remove the **Pay with PayPal** button. Although the form offers the option to pay using PayPal account by default, you can contact your account manager or customer support to turn this option off.
● Manually customize the color of the Pay Now button.

**IMPORTANT:** This compact payment form does not display the buyer's billing address, even if `showBillingAddress=true` is passed. However, for some merchants, it may be necessary to pass the billing address to successfully process the transactions.

---

**Integrating iFrame**

Choose one of the following methods to integrate the compact payment form in your website:

- Manual Integration
- API Integration

**IMPORTANT:** For optimal performance, PayPal recommends that you load the iFrame asset before other assets such as images and JavaScripts. If there are too many assets running on your payment page when you load iFrame, the request for the iFrame may not be placed or might get delayed. This may result in the buyers seeing a blank iFrame.

---

**Manual Integration**

To manually integrate the compact payment form in your website, perform the following steps:

1. Enter the iFrame tag at the location where you want the compact payment form to appear on your website. For example:

   ```html
   <iframe name="hss_iframe" width="570px" height="540px"></iframe>
   ```

   The allowable size for the compact payment form is 570 pixels in width to 540 pixels in height.
2. Below is the iFrame code, add the hidden form that is populated with the appropriate Intégral Evolution variables (including the total amount to be paid) and specify the variable TemplateD. For example,

```html
<form style="display:none" target="hss_iframe" name="form_iframe" method="post"
  <input type="hidden" name="cmd" value="_hosted-payment">
  <input type="hidden" name="subtotal" value="50">
  <input type="hidden" name="business" value="HNZ3QZMCPBAAA">
  <input type="hidden" name="paymentaction" value="sale">
  <input type="hidden" name="template" value="templateD">
  <input type="hidden" name="return" value="https://yourwebsite.com/receipt_page.html">
</form>
```

**NOTE:** If the iFrame transactions fail, pass the billing address. For more a table of HTML variables, see [HTML Variables for Payment Page Settings](#).

3. Ensure that the target name matches the iFrame name, as highlighted in the example below:

```html
<iframe name="hss_iframe" width="570px" height="540px"></iframe>
<form style="display:none" target="hss_iframe" name="form_iframe" method="post"
  ...
</form>
```

4. Submit the form using JavaScript. For example:

```html
<script type="text/javascript">
  document.form_iframe.submit();
</script>
```

**Example of Manual Integration**

The complete example as per the above steps is as follows:

```html
<iframe name="hss_iframe" width="570px" height="540px"></iframe>
<form style="display:none" target="hss_iframe" name="form_iframe" method="post"
  ...
</form>
```
Integrating iFrame in Your Website

Integrating iFrame

```javascript
<script type="text/javascript">
    document.form_iframe.submit();
</script>

API Integration

To integrate the compact payment form in your website using the API, refer to “Using the Button Manager API with Intégral Evolution Checkout” on page 50.

**NOTE:** Use template="templateD" for this type of integration.

There are two options in the response to initiate the Intégral Evolution payment flow:

- Using URL Returned in the Response
- Using Form POST
Integrating iFrame in Your Website

Using URL Returned in the Response

In the URL identified in the response as EMAILLINK, add “src” for iFrame as per the example below to redirect the buyer and initiate the payment flow.

```html
<iframe src="https://securepayments.paypal.com/...?hosted_button_id=HSSS-.." width="570px" height="540px"></iframe>
```

The allowable size of the compact payment form is 570 pixels in width to 540 pixels in height.

**IMPORTANT:** This option is not supported by Safari browsers. Use the Form POST option described below.

Using Form POST

Identify the WEBSITECODE in the response and use the code to create a **Pay Now** button on your review page. When your buyer clicks the button, they are redirected to the PayPal hosted payment page. Like the URL, the button is usable for approximately two hour or until the payment is successful.

1. Enter the iFrame tag at the location where you want the compact payment form to appear on your website. For example:

```html
<iframe name="hss_iframe" width="570px" height="540px"></iframe>
```

The allowable size for the compact payment form is 570 pixels in width to 540 pixels in height.

2. Insert the following in the iFrame tag:

```html
WEBSITECODE=<form
<input type="hidden" name="hosted_button_id" value="HSSS-GDrPDrzuW-ADwkFDMjQmpUK1gTDDdR.tv5alaGS6l.XWVVBlMTMqEnGNoLakufQb89zTj6f6">
<input type="image" src="https://www.paypal.com/i/btn/btn_paynow_LG.gif" border="0" name="submit" alt="PayPal - The safer, easier way to pay online."/>
<img alt="" border="0" src=https://www.paypal.com/i/scr/pixel.gif width="1" height="1">
</form>
```

3. Submit the form using JavaScript. For example:

```html
<script type="text/javascript">
    document.form_iframe.submit();
</script>
```
Example of API (Form POST) Integration

The complete example as per the above steps is as follows:

```html
<iframe name="hss_iframe" width="570px" height="540px"></iframe>

WEBSITECODE=<form
action="https://securepayments.paypal.com/webapps/HostedSoleSolutionApp/web
flow/sparta/hostedSoleSolutionProcess" method="post">
<input type="hidden" name="hosted_button_id" value="HSSS-GDrPDzuW-ADwkFDmJQmpUK1gTDDr.tv5alaGS61.XWVVB1MTMQEnGNoLakufQb89zTjf6"> 
<input type="image" src="https://www.paypal.com/i/btn/btn_paynow_LG.gif" 
border="0" name="submit" alt="PayPal - The safer, easier way to pay 
online."/>
<img alt="" border="0" src="https://www.paypal.com/i/scr/pixel.gif" 
width="1" height="1">
</form>
<script type="text/javascript">
    document.form_iframe.submit();
</script>
```
Integrating Your Website Using API

Using the Button Manager API, you can programmatically create the checkout button that initiates the Intégral Evolution checkout flow on your website. You create the checkout button dynamically when the buyer attempts to checkout on your website. When the buyer clicks on your checkout button, you call the BMCreateButton API operation to create a checkout button and display it on your web page. When the buyer clicks on this checkout button, he or she is redirected to the PayPal payment page where he or she can complete the payment.

HTML variables control the presentation of the PayPal payment pages, the information contained on the pages, and pages to which your buyer can be returned when leaving the payment pages. For a list of HTML variables, refer to “HTML Variables for Payment Page Settings” on page 19.

For complete information on the Button Manager API, see the Button Manager API Reference.

**NOTE:** Using the Button Manager API, you can programmatically create the checkout button, but not manage, edit, or delete it.

---

**Button Hosting**

For Intégral Evolution, using BUTTONTYPE=PAYMENT, you can create the following kinds of checkout buttons:

- **Token buttons** (BUTTONCODE=TOKEN) are not stored on PayPal. They are dynamic and initiate the Intégral Evolution checkout flow. The parameters associated with this kind of button are secure. They have a lifetime of approximately two hours, if not used.

- **Encrypted buttons** (BUTTONCODE=ENCRYPTED) are not stored on PayPal. The parameters associated with this kind of button are encrypted. You must update the web pages that use an encrypted button each time the button or the associated information changes.

- **Clear text buttons** (BUTTONCODE=CLEARTEXT) are not stored on PayPal. The parameters associated with this kind of button are not encrypted. They can be used dynamically because you can change the value of a parameter anytime. However, if you use them, recognize the risk that sensitive information can be altered or stolen.

**NOTE:** Hosted buttons (BUTTONCODE=HOSTED) are not supported for Intégral Evolution and will return an error if used.

For more information about Button Manager API usage, refer to “BMCreateButton API Operation” on page 55.
Using the Button Manager API with Intégral Evolution Checkout

To create a checkout button on your website, you call the BMCreateButton API operation. When the buyer clicks on the checkout button, PayPal initiates the Intégral Evolution checkout flow.

You must decode the response from the BMCreateButton API. For information about URL encoding, refer to the Name-Value Pair API Developer Guide.

There are two options in the response to initiate the Intégral Evolution payment flow:

- Using URL Returned in the Response (Recommended)
- Using Form POST

**Using URL Returned in the Response (Recommended)**

Using the URL identified in the response as EMAILLINK, you can redirect the buyer and initiate the payment flow.

**Example of TOKEN**

EMAILLINK=https://securepayments.paypal.com/webapps/HostedSoleSolutionApp/webflow/sparta/hostedSoleSolutionProcess?hosted_button_id=HSSS-GDrPDzuW-ADwkFDMjQmpUK1gTQedR.tv5alaGS61.XWVVB1MTM6EnGNoLakufQb89zTjf6&HOSTEDBUTTONID=HSSS-GDrPDzuW-ADwkFDMjQmpUK1gTQedR.tv5alaGS61.XWVVB1MTM6EnGNoLakufQb89zTjf6&TIMESTAMP=2010-09-15T00:30:35Z&CORRELATIONID=2fc9a340a2356&ACK=Success&VERSION=65.0&BUILD=1500269
Example of ENCRYPTED

Example of CLEARTEXT

The button variables control the presentation in the flow and the information that is provided to the buyer initially. Because the URL is associated with an Intégral Evolution token, the URL is usable for approximately two hours after it is created or until the payment is successful.

Using Form POST

Identify the WEBSITECODE in the response and use the code to create a Pay Now button on your review page. When your buyer clicks the button, they are redirected to the PayPal hosted payment page. Like the URL, the button is usable for approximately two hours or until the payment is successful.
Example for TOKEN

```
  <input type="hidden" name="hosted_button_id" value="HSSS-GDrPDzw-ADwkJmpUKlgTdxR.tv5alaGS61.XWVB1MTMQEnGNoLakufQb89zTjf6">
  <input type="image" src="https://www.paypal.com/en_US/i/btn/btn_auto_billing_LG.gif" border="0" name="submit" alt="PayPal - The safer, easier way to pay online.">
</form>
```

Example for ENCRYPTED

```
  <input type="hidden" name="encrypted" value="BEGIN PKCS7......END PKCS7">
  <input type="image" src="https://www.paypal.com/en_US/i/btn/btn_auto_billing_LG.gif" border="0" name="submit" alt="PayPal - The safer, easier way to pay online.">
</form>
```

Example of CLEARTEXT

```
  <input type="hidden" name="cmd" value="_hosted-payment">
  <input type="hidden" name="business" value="test1@paypal.com">
  <input type="hidden" name="tax" value="2">
  <input type="hidden" name="shipping" value="3">
  <input type="hidden" name="business" value="K5HHZSMWMCN58">
  <input type="hidden" name="subtotal" value="11">
  <input type="hidden" name="paymentaction" value="sale">
  <input type="hidden" name="handling" value="4">
  <input type="image" src="https://www.paypal.com/en_US/i/btn/btn_auto_billing_LG.gif" border="0" name="submit" alt="PayPal - The safer, easier way to pay online.">
</form>
```
NOTE: The PayPal payment page displays a button identified as Pay Now to complete the checkout flow. The Pay Now button on the PayPal page is different than the Pay Now button created by the BMCreateButton API operation on the review page. You may need to change the URL for the latter in BUTTONIMAGEURL to avoid confusion. If a URL is not specified in BUTTONIMAGEURL, then the default Pay Now is used for the button.

Encrypting Buttons Using Public and Private Key

Using Encrypted Website Payments helps secure payment buttons that you generate or write manually. Encrypted Website Payments protects the HTML button code that contains pricing information by encrypting it. HTML button code that you protect by using Encrypted Website Payments cannot be altered by malicious third parties to create fraudulent payments. For detailed information, refer to Chapter 8, “Protecting Buttons by Using Encrypted Website Payments” on page 67.

Example of Initiating Checkout

The example shows the NVP parameters using BUTTONCODE=TOKEN for creating a URL to initiate the Intégral Evolution checkout flow.

```plaintext
... 
BUTTONCODE=TOKEN 
BUTTONTYPE=PAYMENT 
L_BUTTONVAR0=subtotal=11 
L_BUTTONVAR1=tax=2 
L_BUTTONVAR2=shipping=3 
L_BUTTONVAR3=handling=4 
L_BUTTONVAR4=first_name=Bob 
L_BUTTONVAR5=last_name=Jones 
L_BUTTONVAR6=address1=Gardens 
L_BUTTONVAR7=address2=99343 
L_BUTTONVAR8=city=Paris 
L_BUTTONVAR9=state=Alsace 
L_BUTTONVAR10=zip=75002 
L_BUTTONVAR11=country=FR 
L_BUTTONVAR12=billing_first_name=BobBilling

BMCreateButton API Operation

Use the BMCreateButton API operation to create Intégral Evolution checkout button.

- BMCreateButton Request
- BMCreateButton Response
- BMCreateButton Errors

BMCreateButton Request

The request fields specify the characteristics of your button, which include associated menu items related to the button. You can specify up to 5 menu items, each of which can include up to 10 possible selections.

BMCreateButton Request Fields

**NOTE:** The values you pass must not contain any of these special characters (){}<>";

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>METHOD</td>
<td><em>(Required)</em> BMCreateButton</td>
</tr>
<tr>
<td>BUTTONCODE</td>
<td><em>(Optional)</em> The kind of button code to create. It is one of the following values:</td>
</tr>
<tr>
<td></td>
<td>- TOKEN - A secure button, not stored on PayPal, used only to initiate the Intégral Evolution checkout flow; default for Pay Now button. Since version 65.2</td>
</tr>
<tr>
<td></td>
<td>- ENCRYPTED - An encrypted button, not stored on PayPal</td>
</tr>
<tr>
<td></td>
<td>- CLEARTEXT - An unencrypted button, not stored on PayPal</td>
</tr>
<tr>
<td>BUTTONTYPE</td>
<td><em>(Required)</em> The kind of button you want to create.</td>
</tr>
<tr>
<td></td>
<td>PAYMENT - Pay Now button; since version 65.2</td>
</tr>
<tr>
<td>L_BUTTONVARn</td>
<td><em>(Optional)</em> HTML standard button variables</td>
</tr>
</tbody>
</table>
**BMCreateButton Response**

The response contains an ID if the button is hosted on PayPal, and code for HTML in a website and for a link in email.

**BMCreateButton Response Fields**

<td>ID of a Intégral Evolution token</td>
</tr>
</tbody>
</table>

**BMCreateButton Errors**

Refer to the [PayPal API error codes](#) page to lookup an error code number or an error message.
The PayPal Sandbox is a self-contained environment within which you can prototype and test PayPal features. The PayPal Sandbox is an almost identical copy of the live PayPal website. Its purpose is to give developers a shielded environment for testing and integration purposes, and to help avoid problems that might occur while testing PayPal integration solutions on the live site. Before moving any PayPal-based application into production, you should test the application in the Sandbox to ensure that it functions as you intend and within the guidelines and standards set forth by the PayPal Developer agreement.

For complete details on using the PayPal Sandbox, refer to the Sandbox User Guide.

### Sandbox Account Credentials

**Create a PayPal Sandbox Business account for the country you want to test:**

- Log in to the PayPal developer site: [https://developer.paypal.com/](https://developer.paypal.com/). You can log in with your existing PayPal account credentials or sign-up for a new account.
- Navigate to *Applications > Sandbox accounts* and click the *Create Account* button.
- Choose the country for which you want to test your integration using the *Country* drop-down.
- Set *Bank Verified Account* to *Yes*.
- Complete the rest of the form and click *Create Account*.

**NOTE:** You can use any name for the account, and there is no need to tick the *Login in with PayPal* box.

**Verify Your PayPal Sandbox Business account:**

- Log in to the Sandbox test site ([https://www.sandbox.paypal.com](https://www.sandbox.paypal.com)) using the email address and password from your recently created PayPal Sandbox Business account.
- Click the *Unverified* link on the main *My Account Overview* page.
- Click *Add Bank Account* on the *Get Verified and Lift Sending Limits* page.
- Fill out all the fields with fictitious information.

**NOTE:** *Sort Code* and *Account Number* must be unique numbers.

- Click *Continue*, then *Add Bank Account* to add the test bank account.
- Navigate to the *Set-up Bank Funding* page and click *Continue*.
- Click *Submit* to finish the verification process.
Testing Your Integration in Sandbox
Sandbox Account Credentials

Upgrade to a Pro account:
Click on the arrow next to your Sandbox business account email address, and then click on the Profile link that appears below the email address (highlighted below).

This opens the Sandbox account details window. From the Profile tab of this window, select Upgrade to Pro. Then click the Enable button.
Testing Your Integration in Sandbox

Sandbox Account Credentials

Setup Personal Sandbox Accounts:

From the developer site Applications > Sandbox accounts page you can create multiple business (merchant) and personal (buyer) accounts, which you can use in Sandbox test transactions. See the Sandbox User Guide for more information.

You are ready to test your Intégral Evolution integration on the Sandbox test site.
Testing Your Integration and Settings

The following sections contain information for testing your integration and modifying the look and feel of your payment page in the Sandbox environment.

- Testing Your Integration
- Testing Your Settings

Testing Your Integration

To test your integration in the Sandbox environment, follow the steps specified in “Simple Intégral Evolution Integration” on page 17. For testing purposes, you must make the following changes in the Form POST:

1. Change the URL to point to the Sandbox environment.

   From:

   ```
   <input type="hidden" name="cmd" value="_hosted-payment">
   ```

   to:

   ```
   <input type="hidden" name="cmd" value="_hosted-payment">
   ```

2. Change the business value to the Secure Merchant ID value that is specified at the top of the Profile page of the Sandbox Test Site.

   Accordingly, the Form POST for testing purposes will be:

   ```
   <input type="hidden" name="cmd" value="_hosted-payment">
   <input type="hidden" name="subtotal" value="50">
   <input type="hidden" name="business" value="HNZ3QZMCPBAAA">
   <input type="hidden" name="paymentaction" value="sale">
   <input type="hidden" name="return" value="https://yourwebsite.com/receipt_page.html">
   <input type="submit" name="METHOD" value="Pay Now">
   ```
Testing Your Settings

To change the look and feel of your payment page, modify the settings of the Appearance and Settings pages in the Profile section of the Sandbox Test Site. For complete details, refer to “Modifying Your PayPal Account Settings” on page 24.
Testing Your Integration in Sandbox

Testing Your Integration and Settings
This chapter walks you through the end of end order processing experience. It includes information about verifying the status and authenticity of the order before fulfilling it.

**Verifying Transaction Status and Authenticity**

When the buyer successfully completes a transaction, they are redirected either to the PayPal confirmation page or to a website you specified in the `return` variable or on the Settings page in the Profile section (as outlined in “Simple Intégral Evolution Integration” on page 17). When the browser is redirected to the website you specified, a Transaction ID is appended to it.

**NOTE:** To ensure that the Transaction ID is appended to the return URL, log in to your PayPal merchant account and select **Profile**. In the **Website Payments Standard and Express Checkout** section of the **Profile** page, select **Preferences** and verify that **Auto Return** is set to **On**.

**Auto Return for Website Payments**

Auto Return for Website Payments brings your buyers back to your website immediately after payment completion. Auto Return applies to PayPal Website Payments, including Buy Now, Donations, Subscriptions and Shopping Cart. Learn More

- **Auto Return:** On
- **Off**

On the same settings page, also verify that **Payment Data Transfer** is set to **On**.

**Payment Data Transfer (optional)**

Payment Data Transfer allows you to receive notification of successful payments as they are made. The use of Payment Data Transfer depends on your system configuration and your Return URL. Please note that in order to use Payment Data Transfer, you must turn on Auto Return.

- **Payment Data Transfer:** On
- **Off**

When you receive the redirect (URL with Transaction ID), you must verify that the order was completed successfully on PayPal before sending the items to the buyer. You can do so by checking the confirmation email sent to you by PayPal or by verifying the transaction history. You can also using one of the following methods:
**Validate Instant Payment Notification (IPN)**

IPN enables you to receive messages about transaction payments and activity from PayPal through asynchronous, server-to-server communication. This allows you to integrate your online payments with your order fulfillment process.

Through IPN, you receive messages for the following:

- Payments and their status (pending, complete, or denied)
- Fraud Management Filter actions
- Recurring Payment activity
- Authorisations, chargebacks, disputes, reversals, and refunds.

After a transaction has been processed, PayPal sends an IPN to the notification URL specified in your transaction using the parameter `notify_url`, or in your PayPal Profile. You must verify that the Transaction ID, transaction amount, and other order specific parameters such as Invoice ID that are sent in the IPN match with the information you have in your order processing system. For more details, refer to the Instant Payment Notification (IPN) integration guide.
Execute a GetTransactionDetails API Call

Using GetTransactionDetails API, you can obtain information about a specific transaction.

If you are integrated with PayPal APIs, you can call GetTransactionDetails with the Transaction ID that was returned in the web redirect to validate the authenticity of the order. For complete details, refer to “GetTransactionDetails API” on page 73.

Fulfilling Order

After you have verified the authenticity of the payment amount and status, you can fulfill the order by shipping the item to the buyer.

**NOTE:** To benefit from PayPal’s Seller Protection, the item must be shipped to the address specified on the PayPal payment page or communicated to PayPal. Otherwise, the item is not eligible for Seller Protection. For more information, refer to “Seller Protection” on page 13.
Using Encrypted Website Payments helps secure payment buttons that you generate or write manually. Encrypted Website Payments protects the HTML button code that contains pricing information by encrypting it. HTML button code that you protect by using Encrypted Website Payments cannot be altered by malicious third parties to create fraudulent payments.

Encrypted Website Payments relies on standard public key encryption for protection. With public and private keys, you can dynamically generate HTML code for payment buttons and encrypt the payment details before displaying the buttons on your website. The below table illustrates the sequence of actions that occur with payment buttons protected by using Encrypted Website Payments.

**TABLE 8.1 How Encrypted Website Payments Works**

<table>
<thead>
<tr>
<th>Website Actions</th>
<th>Buyer Action</th>

Public Key Encryption Used by Encrypted Website Payments

Encrypted Website Payments uses public key encryption, or asymmetric cryptography, which provides security and convenience by allowing senders and receivers of encrypted communication to exchange public keys to unlock each others messages. The fundamental aspects of public key encryption are:

- **Public keys** – Public keys are created by receivers and are given to senders before they encrypt and send information. Public certificates comprise a public key and identity information, such as the originator of the key and an expiry date. Public certificates can be signed by certificate authorities, who guarantee that public certificates and their public keys belong to the named entities.

  You and PayPal exchange each others’ public certificates.

- **Private keys** – Private keys are created by receivers are kept to themselves.

  You create a private key and keep it in your system. PayPal keeps its private key on its system.

- **The encryption process** – Senders use their private keys and receivers’ public keys to encrypt information before sending it. Receivers use their private keys and senders’ public keys to decrypt information after receiving it. This encryption process also uses digital signatures in public certificates to verify the sender of the information.

  You use your private key and PayPal’s public key to encrypt your HTML button code. PayPal uses it’s private key and your public key to decrypt button code after people click your payment buttons.

Setting Up Certificates Before Using Encrypted Website Payments

Do the following before you use Encrypted Website Payments to protect your payment buttons:

- **Generating Your Private Key Using OpenSSL**
- **Generating Your Public Certificate Using OpenSSL**
- **Uploading Your Public Certificate to Your PayPal Account**
- **Downloading the PayPal Public Certificate from the PayPal Website**

PayPal uses only X.509 public certificates, not public keys. A public key can be used for decryption but contains no information identifying who provided the key. A public certificate includes a public key along with information about the key, such as when the key expires and who the key belongs to. PayPal accepts public certificates in OpenSSL PEM format from any established certificate authority, such as VeriSign.

You can generate your own private key and public certificate using open source software such as OpenSSL (https://www.openssl.org), which is detailed in the following section.
Protecting Buttons by Using Encrypted Website Payments

Setting Up Certificates Before Using Encrypted Website Payments

Generating Your Private Key Using OpenSSL

Using the openssl program, enter the following command to generate your private key. The command generates a 1024-bit RSA private key that is stored in the file my-prvkey.pem:

`openssl genrsa -out my-prvkey.pem 1024`

Generating Your Public Certificate Using OpenSSL

The public certificate must be in PEM format. To generate your certificate, enter the following openssl command, which generates a public certificate in the file my-pubcert.pem:

`openssl req -new -key my-prvkey.pem -x509 -days 365 -out my-pubcert.pem`

Uploading Your Public Certificate to Your PayPal Account

To upload your public certificate to your PayPal account:

1. Log in to your PayPal account at [https://www.paypal.fr](https://www.paypal.fr)

2. Click the Profile subtab.

3. In the Hosted Payment Settings column, click Website Payment Certificates.

   The Website Payment Certificates page appears.

4. Scroll down the page to the Your Public Certificates section, and click the Add button.

   The Add Certificate page appears.

5. Click Browse, and select the public certificate that you want to upload to PayPal from your local computer.

   **NOTE:** The file you upload must be in PEM format.

6. Click Add.

   After your public certificate is uploaded successfully, it appears in the Your Public Certificates section of the Website Payment Certificates page.

7. Store the certificate ID that PayPal assigned to your public certificate in a secure place. You need the certificate ID that PayPal assigned to encrypt your payment buttons by using the Encrypted Website Payments software provided by PayPal.
Protecting Buttons by Using Encrypted Website Payments
Setting Up Certificates Before Using Encrypted Website Payments

**Downloading the PayPal Public Certificate from the PayPal Website**

To download the PayPal public certificate:

1. Log in to your PayPal account at [https://www.paypal.fr](https://www.paypal.fr)

2. Click the **Profile** subtab.

3. In the **Seller Preferences** column, click the **Encrypted Payment Settings** link.

4. Scroll down the page to the **PayPal Public Certificate** section.

5. Click **Download**, and save the file in a secure location on your local computer.

**Removing Your Public Certificate**

**IMPORTANT:** If you remove your public certificate, its associated certificate ID is no longer valid for encrypting buttons, and any buttons that you generated or wrote manually for your website that use the ID will not function correctly.

To remove one or more of your public certificates:

1. Log in to your PayPal account at [https://www.paypal.fr](https://www.paypal.fr)

2. Click the **Profile** subtab.

3. In the **Seller Preferences** column, click the **Encrypted Payment Settings** link.

4. Scroll down the page to the **PayPal Public Certificate** section.

5. Select the radio button next to the certificate you want to remove, and click **Remove**.

   The **Remove Certificate** page appears.

6. Click **Remove** to confirm the removal of the public certificate that you selected.
Using Encrypted Website Payments to Protect Your Payment Buttons

Encrypted Website Payments includes Java and Microsoft Windows software to protect the payment buttons that you generate or write manually. Download the software from the following location after logging in to PayPal: https://www.paypal.com/us/cgi-bin/webscr?cmd=p/xcl/rec/ewp-code

After you download and extract the software, copy your private key, public certificate, p12 file and the PayPal public certificate to the folder where the software is located.

1. Prepare an input file of Intégral Evolution variables and values for each encrypted button that you want to generate. Each variable and value must be on a separate line, as in the following example.

   **Note:** The cert_id variable identifies the public certificate you uploaded to PayPal website.

   ```plaintext
   cert_id=Z24MFU6DSHBXQ
   cmd=_xclick
   business=sales@company.com
   item_number=1234
   custom=sc-id-789
   amount=500.00
   currency_code=USD
   tax=41.25
   shipping=20.00
   address_override=true
   address1=123 Main St
   city=Austin
   state=TX
   zip=94085
   country=US
   no_note=1
   cancel_return=http://www.company.com/cancel.htm
   ```

2. Run the encryption software using the appropriate syntax, as shown below:

   - **Java:** PPEncrypt CertFile PrivKeyFile PPCertFile InputFile OutputFile [Sandbox]
   - **Microsoft Windows:** java ButtonEncryption CertFile PKCS12File PPCertFile Password InputFile OutputFile [Sandbox]
Protecting Buttons by Using Encrypted Website Payments
Setting Up Certificates Before Using Encrypted Website Payments

where the argument is:

- **CertFile**: The pathname to your own public certificate
- **PKCS12File**: The pathname to the PKCS12-format of your own public certificate
- **PPCertFile**: The pathname to a copy of the PayPal public certificate
- **Password**: The passphrase to the PKCS12-format of your own public certificate
- **InputFile**: The pathname to file containing the non-encrypted Website Payments HTML Form variables
- **OutputFile**: A file name for the encrypted output
- **[Sandbox]**: The optional word Sandbox that lets you test payment buttons in the PayPal Sandbox that you protected with Encrypted Website Payments

3. Copy the encrypted code to your website.

**Blocking Unprotected and Non-encrypted Website Payments**

For extra security of your protected and encrypted buttons, update your PayPal account profile to block unprotected and non-encrypted payments.

To block payments from unprotected and non-encrypted Website Payments Standard buttons:

1. Log in to your PayPal account at [https://www.paypal.fr](https://www.paypal.fr)

2. Click the **Profile** subtab.

3. In the **Seller Preferences** column, click the **Encrypted Payment Settings** link.

4. Scroll down to the **Encrypted Website Payments** section.

5. Next to the **Block Non-encrypted Website Payment** label, select the On radio button.

6. Scroll to the bottom of the page, and click **Save**.
Optional API Operations

Using the Transaction ID, a number of PayPal API operations are available. The most commonly used for Intégral Evolution are:

- GetTransactionDetails API
- RefundTransaction API
- DoCapture API

GetTransactionDetails API

Obtain information about a specific transaction.

- GetTransactionDetails Request
- GetTransactionDetails Response

### GetTransactionDetails Request

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>METHOD</td>
<td>Must be GetTransactionDetails.</td>
</tr>
<tr>
<td>TRANSACTIONID</td>
<td>(Required) Unique identifier of a transaction.</td>
</tr>
</tbody>
</table>

**NOTE:** The details for some kinds of transactions cannot be retrieved with GetTransactionDetails. You cannot obtain details of bank transfer withdrawals, for example.

**Character length and limitations** - 17 single-byte alphanumeric characters.
GetTransactionDetails Response

**NOTE:** All fields defined in the formal structure of GetTransactionDetails Response are not necessarily returned. Data is returned in a response only if PayPal has recorded data that corresponds to the field.

- Receiver Information Fields
- Payer Information Fields
- Payer Name Fields
- Address Fields
- Payment Information Fields
- Payment Item Information Fields
- Payment Item Fields
- Auction Fields
- Subscription Term Fields

**Receiver Information Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RECEIVERMAIL</td>
<td>Primary email address of the payment recipient (the seller). If you are the recipient of the payment and the payment is sent to your non-primary email address, the value of Receiver is still your primary email address.</td>
</tr>
<tr>
<td></td>
<td><strong>Character length and limitations</strong> - 127 single-byte alphanumeric characters</td>
</tr>
<tr>
<td>RECEIVERID</td>
<td>Unique account ID of the payment recipient (the seller). This value is the same as the value of the recipient's referral ID.</td>
</tr>
</tbody>
</table>
### Payer Information Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EMAIL</td>
<td>Email address of payer.</td>
</tr>
<tr>
<td></td>
<td><strong>Character length and limitations</strong> - 127 single-byte characters</td>
</tr>
<tr>
<td>PAYERID</td>
<td>Unique PayPal customer account identification number.</td>
</tr>
<tr>
<td></td>
<td><strong>Character length and limitations</strong> - 13 single-byte alphanumeric characters</td>
</tr>
<tr>
<td>PAYERSTATUS</td>
<td>Status of payer. Valid values are:</td>
</tr>
<tr>
<td></td>
<td>• verified</td>
</tr>
<tr>
<td></td>
<td>• unverified</td>
</tr>
<tr>
<td></td>
<td><strong>Character length and limitations</strong> - 10 single-byte alphabetic characters</td>

## Payment Information Fields

### TABLE A.6 Payment Information Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRANSACTIONID</td>
<td>Unique transaction ID of the payment. Character length and limitations: 17 single-byte characters</td>
</tr>
</tbody>
</table>
| PARENTTRANSACTIONID  | Parent or related transaction identification number. This field is populated for the following transaction types:  
  - Reversal - Capture of an authorised transaction.  
  - Reversal - Reauthorisation of a transaction.  
  - Capture of an order - The value of ParentTransactionID is the original OrderID.  
  - Authorisation of an order - The value of ParentTransactionID is the original OrderID.  
  - Capture of an order authorisation.  
  - Void of an order - The value of ParentTransactionID is the original OrderID.  
  **Character length and limitations** - 16 digits in xxxx-xxxx-xxxx-xxxx format |
| RECEIPTID            | Receipt identification number  
  **Character length and limitations** - 16 digits in xxxx-xxxx-xxxx-xxxx format |
| TRANSACTIONTYPE      | The type of transaction  
  Valid values:  
  - cart  
  - express-checkout  
  **Character length and limitations** - 15 single-byte characters |
| PAYMENTTYPE          | Indicates whether the payment is instant or delayed.  
  **Character length and limitations** - Seven single-byte characters  
  Valid values:  
  - none  
  - echeck  
  - instant |
| ORDERTIME            | Time/date stamp of payment. For example: 2006-08-15T17:23:15Z.               |
| AMT                  | The final amount charged, including any shipping and taxes from your Merchant Profile.  
  **Character length and limitations** - Does not exceed $10,000 USD in any currency. No currency symbol. Regardless of currency, decimal separator is a period (.), and the optional thousands separator is a comma (,). Equivalent to nine characters maximum for USD. |
<p>| CURRENCYCODE         | A three-character currency code.                                          |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FEEAMT</td>
<td>PayPal fee amount charged for the transaction. <strong>Character length and limitations</strong> - Does not exceed $10,000 USD in any currency. No currency symbol. Regardless of currency, decimal separator is a period (.), and the optional thousands separator is a comma (,). Equivalent to nine characters maximum for USD.</td>
</tr>
<tr>
<td>SETTLEAMT</td>
<td>Amount deposited in your PayPal account after a currency conversion.</td>
</tr>
<tr>
<td>TAXAMT</td>
<td>Tax charged on the transaction. <strong>Character length and limitations</strong> - Does not exceed $10,000 USD in any currency. No currency symbol. Regardless of currency, decimal separator is a period (.), and the optional thousands separator is a comma (,). Equivalent to nine characters maximum for USD.</td>
</tr>
<tr>
<td>EXCHANGERATE</td>
<td>Exchange rate if a currency conversion occurred. Relevant only if your are billing in their non-primary currency. If the customer chooses to pay with a currency other than the non-primary currency, the conversion occurs in the customer’s account. <strong>Character length and limitations</strong> - a decimal that does not exceed 17 characters, including decimal point.</td>
</tr>

</table>
Optional API Operations
GetTransactionDetails API

**PAYMENTSTATUS**

Status of the payment.

The status of the payment:

- **None** - No status
- **Canceled-Reversal** - A reversal has been canceled; for example, when you win a dispute and the funds for the reversal have been returned to you.
- **Completed** - The payment has been completed, and the funds have been added successfully to your account balance.
- **Denied** - You denied the payment. This happens only if the payment was previously pending because of possible reasons described for the PendingReason element.
- **Expired** - The authorisation period for this payment has been reached.
- **Failed** - The payment has failed. This happens only if the payment was made from your customer’s bank account.
- **In-Progress** - The transaction has not terminated, e.g. an authorisation may be awaiting completion.
- **Partially-Refunded** - The payment has been partially refunded.
- **Pending** - The payment is pending. See the PendingReason field for more information.
- **Refunded** - You refunded the payment.
- **Reversed** - A payment was reversed due to a chargeback or other type of reversal. The funds have been removed from your account balance and returned to the buyer. The reason for the reversal is specified in the ReasonCode element.
- **Processed** - A payment has been accepted.
- **Voided** - An authorisation for this transaction has been voided.

</table>
| PENDINGREASON | **NOTE:** PendingReason is returned in the response only if PaymentStatus is Pending.  
The reason the payment is pending:  
- none - No pending reason.  
- address - The payment is pending because your customer did not include a confirmed shipping address and your Payment Receiving Preferences is set such that you want to manually accept or deny each of these payments. To change your preference, go to the Preferences section of your Profile.  
- authorisation - This payment is pending because it has been authorised, but not settled. You must capture the funds first.  
- delayed disbursement - Your transaction has been approved and is pending funding from the bank. This typically takes less than 48 hours.  
- echeck - The payment is pending because it was made by an eCheck that has not yet cleared.  
- intl - The payment is pending because you hold a non-U.S. account and do not have a withdrawal mechanism. You must manually accept or deny this payment from your Account Overview.  
- multi-currency - You do not have a balance in the currency sent, and you do not have your Payment Receiving Preferences set to automatically convert and accept this payment. You must manually accept or deny this payment.  
- order - The payment is pending because it is part of an order that has been authorised but not settled.  
- paymentreview - The payment is pending while it is being reviewed by PayPal for risk.  
- unilateral - The payment is pending because it was made to an email address that is not yet registered or confirmed.  
- verify - The payment is pending because you are not yet verified. You must verify your account before you can accept this payment.  
- other - The payment is pending for a reason other than those listed above. For more information, contact PayPal customer service. |
| REASONCODE    | The reason for a reversal if TransactionType is reversal:  
- none - No reason code  
- chargeback - A reversal has occurred on this transaction due to a chargeback by your customer.  
- guarantee - A reversal has occurred on this transaction due to your customer triggering a money-back guarantee.  
- buyer-complaint - A reversal has occurred on this transaction due to a complaint about the transaction from your customer.  
- refund - A reversal has occurred on this transaction because you have given the customer a refund.  
- other - A reversal has occurred on this transaction due to a reason not listed above. |

<td>(Optional) A three-character currency code. Default: USD.</td>
</tr>
</tbody>
</table>
**Optional API Operations**

**DoCapture API**

### Table A.13 DoCapture Request Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| COMPLETETYPE | *(Required)* The value Complete indicates that this the last capture you intend to make.  
The value NotComplete indicates that you intend to make additional captures.  
**NOTE:** If Complete, any remaining amount of the original authorised transaction is automatically voided and all remaining open authorisations are voided.  
**Character length and limitations** - 12 single-byte alphanumeric characters. |
| INVNUM    | *(Optional)* Your invoice number or other identification number that is displayed to the merchant and customer in his transaction history.  
**NOTE:** This value on DoCapture will overwrite a value previously set on DoAuthorisation.  
**NOTE:** The value is recorded only if the authorisation you are capturing is an order authorisation, not a basic authorisation.  
**Character length and limitations** - 127 single-byte alphanumeric characters |
| NOTE      | *(Optional)* An informational note about this settlement that is displayed to the payer in email and in his transaction history.  
**Character length and limitations** - 255 single-byte characters. |
(Optional) The soft descriptor is a per transaction description of the payment that is passed to the consumer’s credit card statement. If a value for the soft descriptor field is provided, the full descriptor displayed on the customer’s statement has the following format:

\[ <\text{PP} \ast | \text{PAYPAL}\ast> \text{<Merchant descriptor as set in the Payment Receiving Preferences>} \text{<1space><soft descriptor>} \]

The soft descriptor can contain only the following characters.

- Alphanumeric characters
- - (dash)
- * (asterisk)
- . (period)
- {space}

If you use any other characters (such as “,”), an error code is returned.

The soft descriptor does not include the phone number, which can be toggled between the merchant’s customer service number and PayPal’s customer service number.

The maximum length of the total soft descriptor is 22 characters. Of this, either 4 or 8 characters are used by the PayPal prefix shown in the data format. Thus, the maximum length of the soft descriptor passed in the API request is:

\[ 22 - \text{len}(<\text{PP} \ast | \text{PAYPAL}\ast>) - \text{len}(\text{<Descriptor set in Payment ReceivingPreferences>} + 1) \]

For example, assume the following conditions:

- The PayPal prefix toggle is set to PAYPAL* in PayPal’s admin tools.
- The merchant descriptor set in the Payment Receiving Preferences is set to EBAY.
- The soft descriptor is passed in as JanesFlowerGifts LLC.

The resulting descriptor string on the credit card would be:

\[ \text{PAYPAL*EBAY JanesFlow} \]

### Table A.13 DoCapture Request Fields

  **Character length and limitations** - 25 single-byte characters. |
| SUFFIX    | Payer’s suffix  
  **Character length and limitations** - 12 single-byte characters. |
If you are moving from PayPal Intégral in HTML (solution also called Website Payments Standard or WPS) to Intégral Evolution, you must make the following changes:

1. In the FORM tag, change the `cmd` value in the action attribute

   from:

   ```html
   <form action="https://www.paypal.com/cgi-bin/webscr" method="post">
   <input type="hidden" name="cmd" value="_xclick">
   ```

   to:

   ```html
   <form action="https://securepayments.paypal.com/webapps/HostedSoleSolutionApp/webflow/sparta/hostedSoleSolutionProcess?cmd=_hosted-payment" method="post"><input type="hidden" name="cmd" value="_hosted-payment">
   ```

2. Change HTML variable `amount` to `subtotal`.

   **Note:** PayPal Intégral in HTML has separate values for `amount` and `quantity`, whereas Intégral Evolution uses `subtotal` only. Ensure that the subtotal includes the amount you want to charge the buyer, taking into account any applicable discount and the quantity of items.

3. If you have already customised your checkout flow, such as color and background, you will need to redo those settings for Intégral Evolution. For more information about customising the look and feel of your payment page, refer to Chapter 3, “Customising Your PayPal Payment Page” on page 23.
Sample Code Comparison

Below is a comparison of PayPal Intégral code and Intégral Evolution code.

**NOTE:** In the samples below, note that for PayPal Intégral HTML, **amount** and **quantity** are specified as 10 and 2 respectively. For Intégral Evolution, the **subtotal** is 20, which is the product of the above-mentioned **amount** and **quantity**. This is highlighted in bold below.

### Sample Website Payments Standard Code

```html
    <input type="hidden" name="cmd" value="_xclick">
    <input type="hidden" name="business" value="seller@designerfotos.com">
    <input type="hidden" name="amount" value="10">
    <input type="hidden" name="quantity" value="2">
    <input type="hidden" name="tax" value="1">
    <input type="hidden" name="currency_code" value="USD">
    <input type="hidden" name="invoice" value="MEM32507725">
    <!-- Enable override of payer’s stored PayPal address. -->
    <input type="hidden" name="address_override" value="1">
    <!-- Set prepopulation variables to override stored address. -->
    <input type="hidden" name="first_name" value="John">
    <input type="hidden" name="last_name" value="Doe">
    <input type="hidden" name="address1" value="345 Lark Ave">
    <input type="hidden" name="city" value="San Jose">
    <input type="hidden" name="state" value="CA">
    <input type="hidden" name="zip" value="95121">
    <input type="hidden" name="country" value="US">
    <input type="hidden" name="bn" value="CC_Partner_WPS">
    <input type="hidden" name="notify_url" value="https://www.paypal.com/IPN/">
    <input type="image" name="submit" border="0" src="https://www.paypal.com/img.gif " />
</form>
```

### Sample Intégral Evolution Code

```html
    <input type="hidden" name="cmd" value="_hosted-payment">
    <input type="hidden" name="business" value="HNZ3QZMCPBAAA">
    <input type="hidden" name="invoice" value="MEM32507725">
    <input type="hidden" name="template" value="TemplateB">
    <!-- Enable override of payer’s stored PayPal address. -->
    <input type="hidden" name="address_override" value="true">
    <!-- Set prepopulation variables to override stored address. -->
    <input type="hidden" name="paymentaction" value="sale">
</form>
```
Error Messages

Refer to the PayPal API error codes page to lookup an error code number or an error message.
The table below lists all the currencies supported by PayPal.
